

SQL Notes

1. SQL

Structured Query Language (SQL) is the core of the relational database used for accessing and managing databases. It is used to manipulate and retrieve data stored in tables and to maintain relationships between those tables. SQL is used to communicate with the database.

2. Sub-queries

A subquery is a query inside another query. The outer query is called the Main Query and the inner query is called the Subquery. The subquery executes first, and its result is passed to the main query. It can be used inside SELECT, UPDATE, DELETE, or other SQL statements and may use comparison operators such as >, <, and =.
